INTERIOR
STEEL
FRAME
DOORS

Main Features:

- Exceptionally thin door frames without compromising durability
- The highest quality galvanized steel
- Powder coated, which ensures a durable and hard microstructure
- Minimalistic design and highest quality
- Custom solutions

Due to the material's strength, Steel Frame Doors have very slender sight lines. A minimal amount of framing material is needed for structural integrity, offering clean and clear views.

Steel Frame Doors span architectural styles, working well in both traditional and modern houses.

All corners and joints of steel Doors are welded, galvanized, and powder-coated, forming an unbroken surface around the frame.

Extremely durable, steel frames are resistant to decay, weather, and fire. They are galvanized (coated with a layer of zinc at very high temperatures) to prevent corrosion.

Unlike wood, steel window frames do not contract and expand in response to weather conditions.

They require minimal upkeep, compared with wood windows and doors.
